

Ponds

Introduction to Ponds

Transform your garden into paradise with a garden pond. Putting in a pond and a gushing cascade you can enjoy the natural serenity water in the garden. Please read further to see a great range of pre-fabricated Ponds. And just remember if we do not have the size you are after we can get them manufactured to size.

Installation Guidelines

1. Marking the Shape

Place the selected pond at the desired location and mark the contour with stakes along the outer edge of the pond. Trace the lower zones lying inside on the ground,

2. Excavating and filling sand layer

It is best to start excavating the deepest part, then "model" the bog areas and finally the bog edge. The pit should be wider and deeper by approximately 10cm than the actual pond shape, because later the pond will be washed in with sand. Stones and roots must be removed from the pit and an approximately 10cm thick sand layer filled in to the pit and compacted,

3. Aligning the pond

The pre-fabricated pond is then positioned and aligned with a spirit level. Here, a roof batten, placed across the pond, is a good help. Before washing in, the pond should be filled to 1/3 with water to prevent the pre-fabricated pond from floating.

4. Washing in the pond

Once the pond has been aligned, the free space between pit and pond shell will be filled with sand and then washed in with a lot of water, so that it will not sag to one side.

5. Filling the pond with water and planting

Before any further filling with water, planting in the pond will be carried out accordingly, if so wished. Finally, the pond will be completely filled with water.
